ATR200 - WATERPROOF VEHICLE TAG

- PROVEN DESIGN
- 12 OR 24 VOLT POWER SOURCE
- SMALL AND COMPACT
- VARIABLE RECEIVE RANGE

DESCRIPTION

The Minecom Radio Frequency Identification (RFID) waterproof vehicle tag has been designed to withstand even the toughest of environments. The vehicle tag was developed to work within various situations, as the tag can be powered directly from a 12 or 24 volt supply, or alternatively can be powered through Lithium Ion battery cells.

The ATR200 tag works when passing through a reader, which recognises the individual identification number. This ID number is then transferred to a central point which will store the movements on a computers hard drive. Should a situation arise where personnel or vehicles could potentially be affected, a simple report will display the last known movements of each tag, so that everyone can be accounted for.

The range of the ATR200 is dependent on the position of the unit and the vehicle it is installed within, as the tag must be located high enough to ensure line of sight between the vehicle mounted unit and the receiver.
