## BLISTER TAG

- COMPACT DESIGN
- LONG LIFE BATTERY
- SUITABLE FOR VARIOUS APPLICATIONS

### DESCRIPTION

The Minecom Blister tag was designed to be utilised in a wide range of applications, as it can simply be glued to either glass or plastic. The Blister tag has been designed in a compact housing, which includes two lithium ion batteries that should provide 12-months of service before requiring new batteries.

The Blister tag works when passing through a reader, which recognises the individual identification number. This ID number is then transferred to a central point which will store the movements on a computers hard drive. Should a situation arise where personnel could potentially be affected, a simple report will display the last known movements of each tag, so that everyone can be accounted for.

So for a simple and versatile RFID tag solution, the Blister tag will suit your needs.
